

REPORT

OF THE

JOINT WATERING COMMITTEE

OF

NORTHERN LIBERTIES & SPRING GARDEN

WATER WORKS:

TOGETHER WITH THE WHOLE COST OF THE EXPENSE OF KEEPING
THEM IN OPERATION TO DECEMBER 31, 1845.

PHILADELPHIA :
BARRETT & JONES, PRINTERS, 34 CARTER'S ALLEY.
1846.

REPORT

Of the whole cost of the Northern Liberties and Spring Garden Water Works, and the Expense of keeping them in operation to December 31st, 1845.

The Joint Watering Committee submit to the Boards of Commissioners of the Districts of Northern Liberties and Spring Garden, the following report of the whole cost of their Water Works, and the expense of keeping them in operation to December 31st, 1845.

Previous to the 15th day of July last, the construction and operation of the works were under the control of the Board of *Water Commissioners*; from that period, they have been under the management of the "Joint Watering Committee."

This report would have been made at an earlier day, but that it might be entirely correct, the Committee deemed it necessary to have the whole accounts of the Commissioners and Committee re-examined, and regularly journalized and posted for all future reference. From these accounts they present Statements A, B, C, and D.

Statement A contains the "whole cost of the works."

Statement B contains expenditures for the districts respectively.

All the matters embraced in these statements were began, completed and settled by the Water Commissioners, and are submitted at this time by the Committee only, because no full statements have heretofore been laid before the Boards of Commissioners on these subjects.

It may be proper to remark that the stated costs of the joint works and districts' mains, are entitled to a credit of \$1,937 57 the estimated value of pipes, castings, tools, &c. yet on hand.

Statement C contains the expense of keeping the works in operation during the year 1845—six and a half months under the direction of the Water Commissioners, and five and a half under that of the Committee.

In this statement there are some items that require explanation. That for "Repairs and Improvements" is very large. Nearly nine hundred dollars is for repairs and alterations of engines, caused by their original imperfect construction, and the subsequent non-compliance of the makers with the terms of their contract. The Committee believe that the districts have an equitable and legal claim upon those gentlemen, for the whole or a part of this sum.

The Committee would also state here, that for some time past both the pump boxes have leaked considerably from fractures in their bottoms, and the valves have worked badly; evidently also from imperfect material or construction. Arrangements have been made with Messrs. Morris & Taws for others, which will be put in as soon as possible.

Most of the remainder of the item for "Repairs and Improvements," was for fixtures and apparatus, or improvements of the real estate, and, therefore, not such as may justly be considered necessary to keep the works in operation, but as tending to increase the value of the property.

The items of "Stationery and Printing," as also that of "Incidental Expenses," are mostly made up of payments for fitting up and supplying the Register's office, and not likely in any future year to reach the tenth of these sums.

The item of "Insurance" is another that will not enter into the expenses of another year, it being for perpetual insurance.

That for "Tools and Ironmongery" will hereafter be comparatively small.

Notwithstanding these heavy expenditures incurred this year, and that will not be required hereafter, the whole cost of keeping the works in operation, it will be seen, is but \$1,767 16 more than was estimated by the Water Commissioners, in their report of December, 1843, as necessary to raise one and a half millions of gallons in each twenty-four hours, and is \$2,332 84 less than was estimated by them it would cost to raise two and a half millions. The actual quantity raised during the year has been an average of 2,035,508 gallons for twenty-four hours, showing the annual

estimate of the Water Commissioners was more than the actual costs has been.

Statement D shows the whole amount of money received by the Water Commissioners, and the Register the purposes for which it has been expended, and the balance left in the hands of the latter.

Statement E exhibits the Profit and Loss of the year's transactions, and is made up in part from the Books of the Joint Committee, and in part from those of the Treasurers of the respective districts.

This statement exhibits a truly gratifying result ; for, notwithstanding the extraordinary difficulties and expenses that always attend the commencement of any great work, and which have been shown to have swelled the expenditures of the past year to a large amount, and notwithstanding the whole cost of the works, for reasons stated by the Commissioners, in their report of January 15th, 1845, exceeds by nearly \$40,000 (\$39,589,69) the amount estimated by the Water Commissioners, in their report of December, 1843, thus increasing the interest on cost of works, yet are the *profits* of the year but \$2,375,79 less than was anticipated by the Water Commissioners, in their report above alluded to,—a sum about equal to the interest on the additional cost of works.

Satisfactory as must be the result of the operation of the works for 1845 to the Boards of Commissioners, and to every citizen of the districts, that which may fairly be estimated for 1846, and which is exhibited in statement F, opens up a still brighter future.

The extraordinary increase of water rents over 1845, is a result not anticipated, but known ; they cannot be diminished, but may be increased during the year. The expenditures for the year are put down the same as for 1845, (though shown to be large) it is not therefore to be conceived that the nett profit of the year will be less than estimated.

If, therefore, this estimate prove correct, and there is no reason to doubt it, there will be an increase of Profits of 50 *per cent.* over that of 1845. Judging from an experience of the cost of keeping the works in operation, and taking into consideration the

probable further outlay that will be necessary to enable the works to supply the increased demand for water that will evidently be made upon them, it is not unreasonable to expect that in six years, or seven at the most, the whole sums paid by the districts for the erections of the works will be repaid to them; and that, thereafter, the revenues derived from their works, if it be thought proper so to apply them, will pay all the municipal expenses of the districts, and the water at the same time be supplied to citizens at a cost less than what they now pay for it; or if it shall be supplied, as it most likely will be, at a sum only sufficient to pay its own proper expenses, it will be at a much lower price than was ever expected by the most sanguine advocates of the constructions of the works.

Appended will also be found *Tables*, prepared by the Register, showing in detail the amount of water rents for the several districts for 1845, and the additions made during the year, also the various purposes for which it is used, and rates at which it is furnished. Similar statements for 1846 are also annexed.

Tables showing the length of pipe laid, and number of Fire-Plugs erected in each district, previous to 1845, and during the year, are also annexed,—also showing the quantity of water raised during each month of the year, and its daily average,—also the time of the workings of the Engines, and other matters believed to be interesting to the Boards.

All of which is respectfully submitted.

Watering Com.
 of
 Spring Garden.

Watering Com.
 of
 N. Liberties.

The following description of the Works was furnished by Wm. E. Morris, C. E., under whose superintendence they were constructed:—

ENGINES AND PUMPS.—There are two expansive condensing engines, and two double acting forcing-pumps.

Steam Cylinders are 36 inches diameter, and 6 feet stroke.

Pump Cylinders are 18 inches diameter, and 6 feet stroke.

These cylinders are placed in the same verticle line, and the pistons move together. At the opposite end of the beam is attached a fly-wheel, 18 feet in diameter, and the rim weighing 8840 lbs. Working velocity is 13 revolutions per minute.

For each engine there is one boiler, so arranged that either engine may receive steam from either or both boilers.

Extreme length 13 feet 8 inches—outer diameter 7 feet 9 inches.

In the lower part are three 18 inch flues, and above these, 94 three inch tubes, [$2\frac{3}{4}$ inches inside,] 9 feet 6 inches long.

The fire is made under the bottom of the boiler, and passes thence, first through the flues entering them at the rear end of the boiler, and then through the tubes to the chimney.

Total fire surface, about 1000 cubic feet. Grate surface for each boiler, 30 square feet—for both, 60 square feet.

The steam pipes and cylinders are clothed with woollen and cased with wood, and the boilers inclosed with brick.

Average working pressure of steam, 16 lbs. per square inch, and the cut-off valves are worked at half stroke.

These valves were not completed at the time the works went into operation, but were started, one on Sept. 15, and the other on Oct 15, 1845.

There is an *air vessel* attached to each pump, having a capacity of about 172 cubic feet each. The operation of these is such, that no variation can be observed in the flow of water from the ascending main into the reservoir.

CHIMNEY.—This is 83 feet in height, 5 feet 8 inches diameter at bottom, and 6 feet 4 inches diameter at top, constructed with double walls throughout; draught powerful, and the combustion of coal rapid.

The bed-plate of pump stands 2 feet above low water of the Schuylkill.

ASCENDING MAINS.—There are two in number, one for each pump, and the same diameter as the pump cylinder, viz: 18 inches.

Total distance from pump to inside of reservoir, 3250 feet.
Total elevation from low water in Schuylkill to average height of surface in reservoir, 115 feet.

RESERVOIRS.—There is but one reservoir, properly speaking, having a division bank 4 feet below top water line, which divides the reservoir into two parts. By reducing the water below this division bank, either part of the reservoir may be emptied, and the use of the other part continued, as an independent reservoir. Usually, the water is pumped into one division, flows over this central bank, and is distributed from the other division.

Contents of reservoir, 9,800,000 gallons—depth of water, 15 feet. The banks of the reservoir are composed of good earth, carted on—the whole lined upon the inside with a course of clay and gravel puddle-stuff, and faced with a brick pavement, laid in the bottom flat, and edgewise upon the slope. The inner and outer slopes vary little from 45 degrees.

DISTRIBUTING MAINS are two in number, 16 inches in diameter. Distance to line of Spring Garden, about $1\frac{1}{4}$ miles.

Do. “ “ “ Northern Liberties, “ $1\frac{3}{4}$ “

DUTY OF THE ENGINES.—By reference to books of the register, it appears that from 1st of April to 31st December, 1845, 3,582,456 lbs. of large lump anthracite coal, equal to 38,111 bushels, of 94 lbs. each, were consumed, and that the engines run during the same time, in the aggregate, 7,244 hours, equal to 434,640 minutes; and the number of strokes made at 26 per minute, equal 11,300,640.

The height to which the water is elevated, as before stated, is - - - - - 115 feet.

To this add the additional height equivalent to the friction in the main, 3250 feet long, which, according to formula—Tredgold on Steam Engines, p. 274—is 8.72

Height equivalent to a vertical height of - 123.72ft.

The load upon the piston of pump, under these circumstances, allowing for piston rod $2\frac{3}{4}$ inches diameter, will be 13,501 lbs.; the coal consumed, as above, 38,111 bushels, of 94 lbs. each. The duty performed will then be as follows:—

13,501 lbs. \times 6ft. stroke \times 11,300,640 strokes

----- = 24,019,818lbs.

38,111 bushels

A little more than 24 millions of lbs. raised one foot high by the consumption of 94 lbs. of coal.

As the cut-off valves were in use but a small portion of this year, a material increase of duty should be realized hereafter.
